

I am sending you a small task for you to prepare and return to me before we proceed on the next step.

The attached files contains some mock data of **recolour requests (Ticket 1-4)**.

Use the files and create a small project. Here's some ideas:

- 1.Recolour Ticket Creation – Form to create a ticket with photo ID, style, priority, and partner.
- 2.Ticket Queue – List all tickets with status (Pending, Sent, In Progress, Completed, Rejected) and filters.
- 3.Partner Integration – Simulate sending tickets to partners and show receipt status.
- 4.Approval & Storage – Approve to store in "Approved Photos," reject to return to queue.
- 5.Navigation – Main menu and sidebar (Queue, Approved Library, Partner Overview).

Nice to have:

- Add role-based views (e.g., Operator can create tickets, Manager can approve).
- Add a small dashboard with KPIs (e.g., "10 tickets pending", "3 awaiting approval").

For this project, we would like you to use Vue 3, as the frontend framework and Express, as the backend framework. The design is up to you.

Try to achieve as many points as you can. Looking forward to your solution!
